(Introduction to Cloud Computing + Computing Environment)
وبصياغة قريبة جداً من النص الموجود فيهم
المصدر الأساسي:

(1) What is the main difference between Cloud Computing and traditional computing?

Traditional computing requires local infrastructure and server rooms, while cloud computing provides on-demand resources over the Internet.

(2) What makes Cloud Computing attractive to customers?

Reduced capital cost, pay-per-use model, scalability, remote accessibility, and easier maintenance.

(3) What makes Cloud Computing attractive to IT companies?

It enables large-scale service delivery, high utilization of infrastructure, and continuous service-based revenue.

(4) Why is selling Cloud as a service attractive?

Because services are delivered as hosted solutions instead of selling hardware, software, and licenses separately.

(5) What environmental consequences do we expect?

Cloud supports Green Computing through energy-efficient large-scale data centers and optimized resource usage.

(6) What are consequences for employees?

IT staff focus more on management and innovation instead of maintaining servers and infrastructure.

(7) What are the two main types of IT clouds?

Private Cloud and Public Cloud.

(8) What is the difference between private and public clouds?

Private cloud is owned by a single organization; public cloud is owned by a third-party provider and publicly accessible.

(9) How private is a private cloud?

It is limited to a single organization but still operates using cloud mechanisms.

(10) What does “economy of scale” mean?

Large-scale operations reduce cost per unit of IT resource through shared infrastructure.

(11) Why can Cloud services be cheaper?

Because infrastructure is shared among multiple users and costs are distributed.

(12) Can local laws be stricter?

Yes, data location and compliance laws may require stricter regulations depending on country.

(13) Who is legally responsible for compliance?

The cloud consumer organization remains responsible for legal compliance.

(14) What is the difference between TCA and TCO?

TCA refers to acquisition cost, while TCO includes total cost including operation and maintenance.

(15) What is Multitenancy?

A single cloud instance serves multiple consumers while keeping their data isolated.

(16) Difference between IaaS, PaaS, SaaS?

IaaS provides infrastructure, PaaS provides development platforms, and SaaS provides software applications.

(17) What is XaaS?

It refers to delivering various IT services over the Internet as a service model.

(18) What is Resource Pooling?

Shared pool of configurable computing resources dynamically allocated to users.

(19) What is Scalability and Elasticity?

Scalability increases capacity; elasticity rapidly provisions and releases resources based on demand.

(20) Difference between Cloud and Dedicated Servers?

Cloud servers are virtual and scalable; dedicated servers are physical and assigned to one organization.

(21) What is Grid Computing?

Distributed computing using heterogeneous and geographically dispersed resources.

(22) Define Cloud Computing simply.

Delivery of hosting services and computing resources over the Internet on-demand.

(23) What are Cloud Characteristics?

On-demand self-service, scalability, elasticity, multi-sharing, pay-per-use, and remote accessibility.

(24) What is Elasticity?

Ability to adapt to workload changes by provisioning and de-provisioning resources dynamically.

(25) What is IT provisioning?

Allocating computing resources to handle workload demand.

(26) What is Over-provisioning?

Allocating more resources than needed; improves performance but increases cost and waste.

(27) What is Under-provisioning?

Allocating fewer resources than required, causing performance degradation and unreliable availability.

(28) What is Dynamic Provisioning?

Activating only the necessary number of resources to meet current demand.

(29) How does Dynamic Provisioning optimize resources?

It matches capacity with demand and avoids over- or under-provisioning.

(30) What are Cloud Advantages?

Cost savings, scalability, flexibility, collaboration, reliability, disaster recovery, and green computing.

(31) What are Cloud Disadvantages?

Vendor reliability issues, limited control, data security concerns, hidden costs, and dependency on provider.

(32) Difference between Cloud Service Models?

IaaS rents infrastructure, PaaS provides development environment, SaaS delivers complete software applications.

(33) User Levels of Control in IaaS, PaaS, SaaS?

IaaS: user controls OS and applications; PaaS: user controls applications only; SaaS: provider controls infrastructure and application.
